

# Deep Learning

LEADING Bootcamp

# Artificial Neural Network (ANN)

- Artificial Neural Network (ANN) is a Machine Learning model inspired by the networks of biological neurons found in our brains.
- ANN is the core of Deep Learning.

# Perceptron

- Binary classifier that maps input to an output
- One of the simplest ANN architectures
- Based on Linear Threshold unit (LTU)

$$h_{\theta}(x) = \begin{cases} 0 & \text{if } \sum_j \theta_j x_j \leq \text{threshold} \\ 1 & \text{if } \sum_j \theta_j x_j > \text{threshold} \end{cases}$$

# Perceptron

```
>>> from sklearn.linear_model import Perceptron  
  
>>> per_clf = Perceptron(random_state=42)  
>>> per_clf.fit(X, y)  
  
>>> per_clf.predict([[2, 0.5]])
```

- Decision boundary is linear, incapable of learning complex patterns
- This is the weakness of any other linear classifiers

# Architecture

• Activation function:  $g(z) = \frac{1}{1+e^{-z}}$

Input Layer

Hidden Layer

Output Layer

# Logical computation

➤  $x_0 = 1$

➤  $x_1, x_2 \in \{0, 1\}$

➤  $\theta_0 = -30$

➤  $\theta_1 = 20$

➤  $\theta_2 = 20$

➤  $y = x_1 \text{ AND } x_2$

➤  $h_\theta(x) = g(-30 + 20x_1 + 20x_2)$

$x_1$	$x_2$	$h_\theta(x)$
0	0	0
0	1	0
1	0	0
1	1	1

# Logical computation

➤  $x_0 = 1$

➤  $x_1, x_2 \in \{0, 1\}$

➤  $\theta_0 = -10$

➤  $\theta_1 = 20$

➤  $\theta_2 = 20$

➤  $y = x_1 \text{ OR } x_2$

➤  $h_\theta(x) = g(-10 + 20x_1 + 20x_2)$

$x_1$	$x_2$	$h_\theta(x)$
0	0	0
0	1	1
1	0	1
1	1	1

# Logical computation

➤  $x_0 = 1$

➤  $x_1 \in \{0, 1\}$

➤  $\theta_0 = 10$

➤  $\theta_1 = -20$

➤  $y = \text{NOT } x_1$

➤  $h_{\theta}(x) = g(10 - 20x_1)$

$x_1$	$h_{\theta}(x)$
0	1
1	0

# Logical computation

➤  $x_0 = 1$

➤  $x_1, x_2 \in \{0, 1\}$

➤  $\theta_0 = 10$

➤  $\theta_1 = -20$

➤  $\theta_2 = -20$

➤  $y = (\text{NOT } x_1) \text{ AND } (\text{NOT } x_2)$

➤  $h_\theta(x) = g(10 - 20x_1 - 20x_2)$

$x_1$	$x_2$	$h_\theta(x)$
0	0	1
0	1	0
1	0	0
1	1	0

$$y = x_1 \text{ XNOR } x_2$$

- $a_1^{(1)}$ :  $x_1$  AND  $x_2$
- $a_2^{(1)}$ : (NOT  $x_1$ ) AND (NOT  $x_2$ )
- $a_1^{(2)}$ :  $a_1^{(1)}$  OR  $a_2^{(1)}$

$x_1$	$x_2$	$a_1^{(1)}$	$a_2^{(1)}$	$h_\theta(x)$
0	0	0	1	1
0	1	0	0	0
1	0	0	0	0
1	1	1	0	1

# Multi-layer Perceptron (MLP)

- An ANN contains a deep stack of hidden layers is called Deep Neural Network (DNN)

# Non-Linear Activation Function

- Tanh (The hyperbolic tangent function):  $\tanh(z) = \frac{2}{1+e^{-2z}} - 1$ 
  - Continuous and differentiable
  - Range:  $[-1, 1]$ , help speed up convergence
- ReLU (Rectified Linear Unit function):
  - Continuous and differentiable (except for  $z = 0$ )
  - Fast to compute, usually set as default

# MLP Classification

```
>>> from sklearn.neural_network import MLPClassifier
```

```
>>> mlp = MLPClassifier().fit(X_train, y_train)
```

Train score: 0.9867

Test score: 0.9200

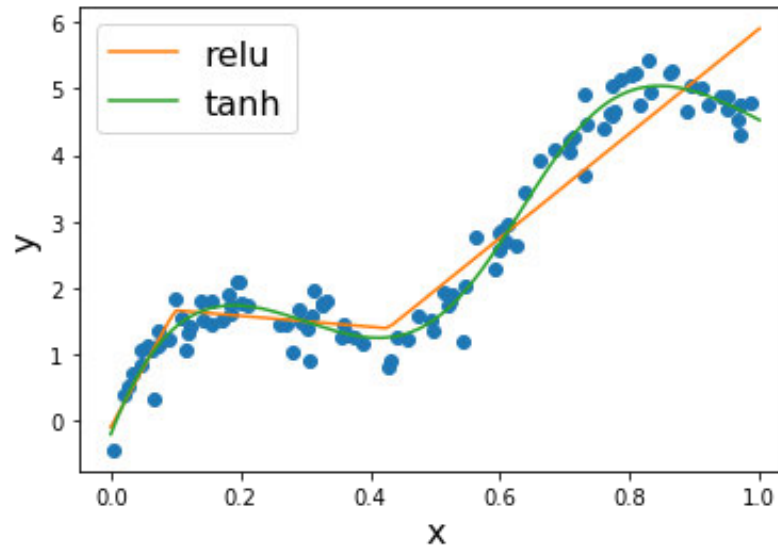

Train score: 0.9467

Test score: 0.9600

# MLP Regression

```
>>> from sklearn.neural_network import MLPRegressor  
  
>>> mlp_relu = MLPRegressor(solver="lbfgs").fit(X, y)  
  
>>> mlp_tanh = MLPRegressor(solver="lbfgs",  
activation='tanh').fit(X, y)
```

# MLP summary

- Can be formed into advanced architecture: RNN, CNN...
- Capable of capture complex features
- Work well with large datasets
- Problems:
  - Longer training time – require GPUs
  - Prone to overfitting
  - Careful pre-processing is needed
  - Similarly to SVMs and other linear models, they work best with “homogeneous” data, where all the features have similar meanings.
  - For data that has very different kinds of features, tree-based models might work better.
